

IN THE CLAIMS:

Please AMEND claims 1-7 and 9, as follows.

1. (Currently Amended) A movable micro-body comprising:

a movable plate having a surface;

at least one or two torsion bars bar extending in a longitudinal direction and

supporting ~~the~~ said movable plate;

a support member supporting ~~the~~ said movable plate by way of ~~the one or two said~~  
torsion bars bar; and

at least one link member arranged in a direction intersecting the longitudinal  
direction of ~~the one or two said~~ torsion bars bar and ~~adapted to substantially link the linking said~~  
support member and ~~the movable plate by way of a through hole region~~ said torsion bar.

2. (Currently Amended) The movable micro-body according to claim 1,

wherein

~~said~~ two torsion bars are arranged at opposite sides of said movable plate, and ~~said~~  
~~at least one~~ a link member is arranged on each of said ~~two~~ torsion bars.

3. (Currently Amended) The movable micro-body according to claim 1,

wherein

~~said~~ only one torsion bar is provided ~~solely~~ and arranged at a lateral side of said  
movable plate, and said ~~at least one~~ link member is arranged on said ~~one~~ torsion bar.

4. (Currently Amended) The movable micro-body according to claim 1,  
wherein

said only one torsion bar is provided ~~solely~~ and arranged at a lateral side of said movable plate, and said movable plate is provided with a projecting section at ~~the~~ a side opposite to said ~~one~~ torsion bar, with said projecting section being separated from said support member, with said ~~at least one~~ link member being arranged on said projecting section.

5. (Currently Amended) The movable micro-body according to claim 1,  
wherein

~~the~~ a cross section of said ~~one or two~~ torsion bars bar taken along a direction perpendicular to ~~the~~ an intra-planar direction of said movable plate surface shows a width as observed along ~~the~~ a longitudinal direction of said ~~at least one~~ link member smaller than ~~the~~ a width of ~~the~~ a cross section as observed along the direction perpendicular to ~~said~~ the longitudinal direction.

6. (Currently Amended) The movable micro-body according to claim 1,  
wherein

said support member, said ~~one or two~~ torsion bars bar and said movable plate are integrally formed from a single material.

7. (Currently Amended) The movable micro-body according to claim 1,  
wherein

said ~~at least one~~ link member is made of a material different from at least one of ~~that of~~ said support member, ~~that of~~ said ~~one or two~~ torsion bars bar or ~~that of~~ said movable plate.

8. (Original) An optical deflector comprising a movable micro-body according to claim 1 and light reflecting means arranged on said movable plate.

9. (Currently Amended) An image forming apparatus comprising an optical deflector according to claim 8 and a light source, and adapted to form an image by causing a beam of light emitted from said light source to be reflected by said light reflecting means and ~~scan~~ scanned.

10. (Original) The image forming apparatus according to claim 9 that is a light beam scanning type display.

11. (Original) An electrophotography type image forming apparatus comprising an image forming apparatus according to claim 9 and a photosensitive body adapted to receive the scanning beam of light.

12. (Original) A dynamic quantity sensor comprising a movable micro-body according to claim 1 and detection means for detecting a relative positional displacement of said support member and said movable plate.
